If the calling thread already holds the lock on `*this`, the function returns `true` and the count of locks on `*this` held by the calling thread is increased by one. If the current thread doesn't already hold a lock on `*this`, the function may fail to acquire the lock (and return `false`) even if no other thread holds a lock on `*this`. The thread may be blocked for longer than the specified duration. Where possible, the elapsed time is determined by a steady clock.

Std::Recursive_Timed_Mutex::Try_Lock_Until Member Function

Attempts to acquire a lock on a `std::recursive_timed_mutex` object for the current thread.

Declaration

```
template<typename Clock,typename Duration>
bool try_lock_until(
    std::chrono::time_point<Clock,Duration> const& absolute_time);
```

Effects

Attempts to acquire a lock on `*this` for the calling thread before the time specified by `absolute_time`. If `absolute_time<=Clock::now()` on entry, the call will return immediately, as if it was a call to `try_lock()`. Otherwise, the call blocks until either the lock has been acquired or `Clock::now()` returns a time equal to or later than `absolute_time`.

Returns

`true` if a lock was obtained for the calling thread, `false` otherwise.

Postconditions

`*this` is locked by the calling thread if the function returns `true`.
