Throws

Nothing.

Postconditions

`*this` owns the lock on `m` held by the calling thread.

Std::Lock_Guard Destructor

Destroys a `std::lock_guard` instance and unlocks the corresponding mutex.

Declaration

```
~lock_guard();
```

Effects

Calls `m.unlock()` for the mutex instance `m` supplied when `*this` was constructed.

Throws

Nothing.

D.5.6. std::unique_lock class template

The `std::unique_lock` class template provides a more general lock ownership wrapper than `std::lock_guard`. The type of mutex being locked is specified by the template parameter `Mutex`, which must meet the `BasicLockable` requirements. In general, the specified mutex is locked in the constructor and unlocked in the destructor, although additional constructors and member functions are provided to allow other possibilities. This provides a means of locking a mutex for a block of code and ensuring that the mutex is unlocked when the block is left, whether that's by running
