Postconditions

`this->owns_lock()` returns the result of the `m.try_lock_until()` call, `this->mutex()==&m`.

Std::Unique_Lock Move-Constructor

Transfers ownership of a lock from one `std::unique_lock` object to a newly created `std::unique_lock` object.

Declaration

```
unique_lock(unique_lock&& other) noexcept;
```

Effects

Constructs a `std::unique_lock` instance. If `other` owned a lock on a mutex prior to the constructor invocation, that lock is now owned by the newly created `std::unique_lock` object.

Postconditions

For a newly constructed `std::unique_lock` object `x, x.mutex()` is equal to the value of `other.mutex()` prior to the constructor invocation, and `x.owns_lock()` is equal to the value of `other.owns_lock()` prior to the constructor invocation. `other.mutex()==NULL, other.owns_lock()==false`.

Throws

Nothing.

Note

`std::unique_lock` objects are *not* `CopyConstructible`, so there's no copy constructor, only this move constructor.
