Breaks the association of the mutex with `*this` without unlocking any locks held.

Returns

A pointer to the mutex associated with `*this` prior to the call if any, `NULL` otherwise.

Postconditions

```
this->mutex()==NULL, this->owns_lock()==false.
```

Throws

Nothing.

Note

If `this->owns_lock()` would have returned `true` prior to the call, the caller would now be responsible for unlocking the mutex.

D.5.7. std::lock function template

The `std::lock` function template provides a means of locking more than one mutex at the same time, without risk of deadlock resulting from inconsistent lock orders.

Declaration

```
template<typename LockableType1,typename... LockableType2>
void lock(LockableType1& m1,LockableType2& m2...);
```

Preconditions
