Class definition

```
class thread::id
{
public:
    id() noexcept;
};

bool operator==(thread::id x, thread::id y) noexcept;
bool operator!=(thread::id x, thread::id y) noexcept;
bool operator<(thread::id x, thread::id y) noexcept;
bool operator<=(thread::id x, thread::id y) noexcept;
bool operator>(thread::id x, thread::id y) noexcept;
bool operator>=(thread::id x, thread::id y) noexcept;

template<typename charT, typename traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>&& out, thread::id id);
```

Notes

The `std::thread::id` value that identifies a particular thread of execution shall be distinct from the value of a default-constructed `std::thread::id` instance and from any value that represents another thread of execution.

The `std::thread::id` values for particular threads aren't predictable and may vary between executions of the same program.

`std::thread::id` is `CopyConstructible` and `CopyAssignable`, so instances of `std::thread::id` may be freely copied and assigned.

Std::Thread::Id Default Constructor

Constructs a `std::thread::id` object that doesn't represent any thread of execution.

Declaration

```
id() noexcept;
```
