Effects

Constructs a `std::thread::id` instance that has the singular *not any thread* value.

Throws

Nothing.

Note

All default-constructed `std::thread::id` instances store the same value.

Std::Thread::Id Equality Comparison Operator

Compares two instances of `std::thread::id` to see if they represent the same thread of execution.

Declaration

```
bool operator==(std::thread::id lhs,std::thread::id rhs) noexcept;
```

Returns

`true` if both `lhs` and `rhs` represent the same thread of execution or both have the singular *not any thread* value. `false` if `lhs` and `rhs` represent different threads of execution or one represents a thread of execution and the other has the singular *not any thread* value.

Throws

Nothing.
