The singular *not any thread* value held by a default-constructed `std::thread::id` instance compares less than any `std::thread::id` instance that represents a thread of execution. If two instances of `std::thread::id` are equal, neither is less than the other. Any set of distinct `std::thread::id` values forms a total order, which is consistent throughout an execution of a program. This order may vary between executions of the same program.

Std::Thread::Id Less-Than or Equal Comparison Operator

Compares two instances of `std::thread::id` to see if one lies before the other in the total ordering of thread ID values or is equal to it.

Declaration

```
bool operator<=(std::thread::id lhs,std::thread::id rhs) noexcept;
```

Returns

```
!(rhs<lhs)
```

Throws

Nothing.

Std::Thread::Id Greater-Than Comparison Operator

Compares two instances of `std::thread::id` to see if one lies after the other in the total ordering of thread ID values.

Declaration

```
bool operator>(std::thread::id lhs,std::thread::id rhs) noexcept;
```

Returns

```
rhs<lhs
```
