Declaration

```
thread(thread&& other) noexcept;
```

Effects

Constructs a `std::thread` instance. If `other` has an associated thread of execution prior to the constructor invocation, that thread of execution is now associated with the newly created `std::thread` object. Otherwise, the newly created `std::thread` object has no associated thread of execution.

Postconditions

For a newly constructed `std::thread` object `x, x.get_id()` is equal to the value of `other.get_id()` prior to the constructor invocation. `other.get_id()==id()`.

Throws

Nothing.

Note

`std::thread` objects are *not* `CopyConstructible`, so there's no copy constructor, only this move constructor.

Std::Thread Destructor

Destroys a `std::thread` object.

Declaration

```
~thread();
```
