Detaches the thread of execution associated with `*this`.

*Postconditions*

```
this->get_id()==id(), this->joinable()==false
```

The thread of execution associated with `*this` prior to the call is detached and no longer has an associated `std::thread` object.

*Throws*

`std::system_error` if the effects can't be achieved or `this->joinable()` returns `false` on invocation.

#### Std::Thread::Get_Id Member Function

Returns a value of type `std::thread::id` that identifies the thread of execution associated with `*this`.

*Declaration*

```
thread::id get_id() const noexcept;
```

*Returns*

If `*this` has an associated thread of execution, returns an instance of `std::thread::id` that identifies that thread. Otherwise returns a default-constructed `std::thread::id`.

*Throws*

Nothing.

#### Std::Thread::Hardware_Concurrency Static Member Function

Returns a hint as to the number of threads that can run concurrently on the current hardware.
