Used to inform the library that the thread that invoked the function doesn’t need to run at the point of the call. Commonly used in tight loops to avoid consuming excessive CPU time.

Declaration

```
void yield() noexcept;
```

Effects

Provides the library an opportunity to schedule something else in place of the current thread.

Throws

Nothing.

Std::This_Thread::Sleep_For Nonmember Function

Suspends execution of the current thread for the specified duration.

Declaration

```
template<typename Rep,typename Period>
void sleep_for(std::chrono::duration<Rep,Period> const&
relative_time);
```

Effects

Blocks the current thread until the specified `relative_time` has elapsed.

Note

The thread may be blocked for longer than the specified duration. Where possible, the elapsed time is determined by a steady clock.
