designing for testability
detecting potential deadlocks
eliminate concurrency
environmental considerations
false confidence
general guidelines
general outline
general setup
levels of confidence
library functions with internal state
memory ordering issues
on single- vs. multicore systems
performance testing
scalability
techniques
test granularity
test structure, 2nd
testing on single-processor systems
testing with a debug library
thread-specific setup
unpredictable scheduling
verifying a bug is concurrency related
vs. testing single-threaded code
thread function
passing arguments
avoiding undefined behavior
by reference
moving
type of arguments
using a member function
using std::ref for arguments
thread pool, 2nd
and exception safety
cache locality
choosing a task size
contention
