logging, but the values have no semantic meaning, so there's not much more that could be said anyway.

## 2.6. Summary

In this chapter I covered the basics of thread management with the C++ Standard Library: starting threads, waiting for them to finish, and *not* waiting for them to finish because you want them to run in the background. You also saw how to pass arguments into the thread function when a thread is started, how to transfer the responsibility for managing a thread from one part of the code to another, and how groups of threads can be used to divide work. Finally, I discussed identifying threads in order to associate data or behavior with specific threads that's inconvenient to associate through alternative means. Although you can do quite a lot with purely independent threads that each operate on separate data, as in listing 2.8 for example, sometimes it's desirable to share data among threads while they're running. Chapter 3 discusses the issues surrounding sharing data directly among threads, while chapter 4 covers more general issues surrounding synchronizing operations with and without shared data.
