Chapter 9. Advanced thread management

- Listing 9.1. Simple thread pool
- Listing 9.2. A thread pool with waitable tasks
- Listing 9.3. parallel_accumulate using a thread pool with waitable tasks
- Listing 9.4. An implementation of run_pending_task()
- Listing 9.5. A thread pool–based implementation of Quicksort
- Listing 9.6. A thread pool with thread-local work queues
- Listing 9.7. Lock-based queue for work stealing
- Listing 9.8. A thread pool that uses work stealing
- Listing 9.9. Basic implementation of interruptible_thread
- Listing 9.10. A broken version of interruptible_wait for std::condition_variable
- Listing 9.11. Using a timeout in interruptible_wait for std::condition_variable
- Listing 9.12. interruptible_wait for std::condition_variable_any
- Listing 9.13. Monitoring the filesystem in the background

Chapter 10. Testing and debugging multithreaded applications

- Listing 10.1. An example test for concurrent push() and pop() calls on a queue

Appendix A. Brief reference for some C++11 language features

- Listing A.1. A class with a move constructor
- Listing A.2. A simple move-only type
- Listing A.3. A class with a trivial default constructor
- Listing A.4. A simple lambda with a deduced return type

Appendix C. A message-passing framework and complete ATM example
