

Figure 10.3 The Frequent Flyer domain object as described in discussions with the business

member has a name, a unique Frequent Flyer number, and a current status. Possible status values are Bronze, Silver, Gold, and Platinum. The Frequent Flyer domain model could look like the one in figure 10.3.

Armed with this understanding of the domain, you can now implement the second step definition, which will involve code that manipulates this domain object.

10.2.6 Write the code you'd like to have

When you write a step definition, you write the code you'd like to have if you were a developer using the code. In other words, you imagine the ideal classes and methods for your current needs, and write sample code that illustrates how you'd exercise these classes and methods. This idea of writing the code you'd like to have is an important part of outside-in development.

For example, you might implement the second step definition like this:

```
FrequentFlyer member;

@When("^(?:s?)he registers on the Frequent Flyer program$")
public void registers_on_the_Frequent_Flyer_program() throws Throwable {
    member = FrequentFlyer.withFrequentFlyerNumber("123456789")
                          .named(firstName, lastName);
}
```

Application code illustrating how to create a new Frequent Flyer member ❶

This approach is a great way to design a class, because the code used in the step definitions will be very similar to the code used in the actual application. Writing the code in the step definitions is a way of exploring the objects and methods you'll need to implement a particular acceptance criterion and of discovering the cleanest and most elegant way to do so.

Note that the `FrequentFlyer` class mentioned in the code ❶ doesn't exist yet; you've just specified what it should look like. The next step is to actually implement this code.

10.2.7 Use the step definition code to specify and implement the application code

You can now switch gears and consider the requirements in more granular terms. The high-level requirements expressed in the acceptance criteria often break down into more detailed, low-level requirements.
