

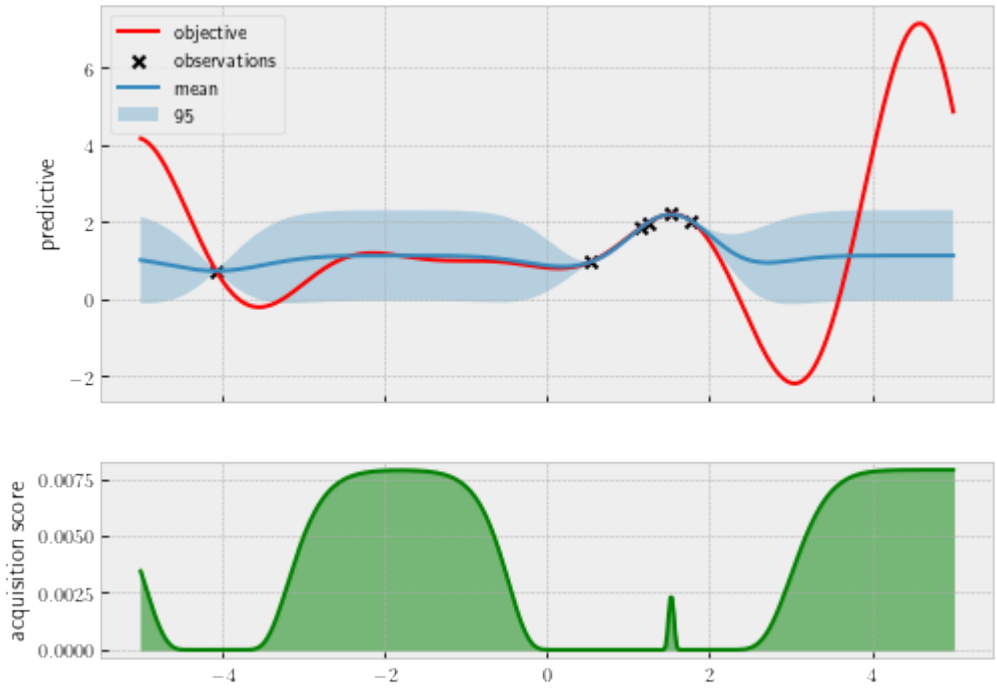

Figure 1.11 After exploring a local optimum sufficiently, we are encouraged to look at other areas.

After having five queries to scope out this locally optimal region, our policy decides that there are other, more promising regions to explore, namely the one to the left around -2, and the one to the right around 4. This is very reassuring, as it shows that once we have explored a region enough, Bayesian optimization does not get stuck in that region.

Let's now see what happens after eight queries in Figure 1.12.
