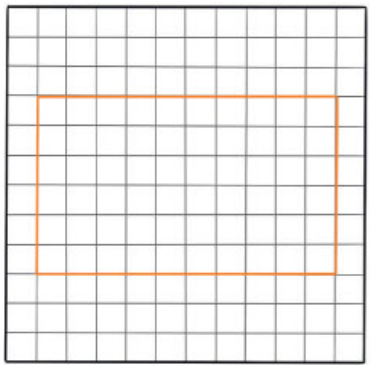
Game science

The pieces CAN all fit on the board, but only if you figure out the right way to arrange them. If you’re playing an opponent, try to make it harder for them by blocking their best moves!

Set it up

1 Draw a rectangle to make a playing board. Ten squares long and six squares high is a good size to start with.



2 Take some more graph paper and cut it up into playing pieces, each made of three squares. There are two shapes you can make, known as “triominoes.” For a 10 x 6 square board, make 10 of each shape, using 60 squares in total.
