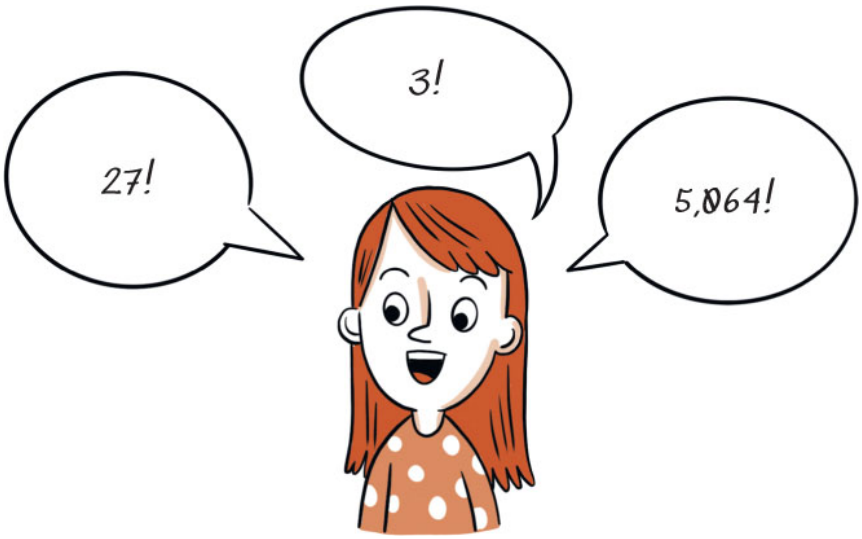
4 The players in each team have to find the three cards with 4, 7, and 2 on them, and line up a row of three people, each holding a card. And, of course, they have to be in the right order from the point of view of the caller and the other team.

5 The number the caller chooses can have any number of digits, up to the number of people on each team—so that there will be enough people to hold up the cards. So if each team has four people, the numbers can be one, two, three, or four digits.



6 If there are more players in each team, the caller can use longer numbers.

7 However, since each team only has one of each number, the digits must all be different. For example, you can use 6,371, but not 6,333—since the teams only have one card with a 3 on it.
