

2 Then they both split into two, making four.

3 Imagine that the bacteria did this once a day.

Does this look familiar? You might recognize it as one of the sequences from the previous page. Well spotted!

On day 1, there would be ...	
On day 2, there would be ...	
On day 3, there would be ...	
On day 4, there would be ...	
On day 5, there would be ...	

Leave them to it, and eventually there will be over a million bacteria!

4 So the question is … when do you think that would happen? If there's one bacterium on day one, which day will it be when they pass the one million (1,000,000) mark?
