

- *Modularity*—Each component is a self-contained unit, simplifying development, testing, and maintenance by isolating functionality.
- *Reusability*—Components can be reused across different parts of the application or even across multiple projects, ensuring consistency and reducing duplication.
- *Scalability*—Applications can grow in complexity by composing smaller building blocks into larger UIs without creating tangled dependencies.

React components can be categorized based on their ability to manage state:

- Stateful components (container components) manage their own data and user interactions. They handle complex UI logic, data fetching, and
