The following components have been designed to implement the blog post feature:

- Stateful components
  - `BlogPostApp`(`use-cases/BlogPostApp.tsx`)—The top-level orchestrator.
  - `PostLikes`(`components/post-likes/PostLikes.tsx`)—Handles like functionality.
  - `PostComments`(`components/post-comments/PostComments.tsx`)—Manages the comments feature.
- Stateless components
  - `BlogPost`(`components/blog-post/BlogPost.tsx`)—Displays blog content.
  - `Comment`(`components/post-comments/Comment.tsx`)—Renders individual comments.
  - `IconButton`(`components/icon-buttons/IconButton.tsx`)—Provides reusable icon buttons.

The codebase organizes components by feature and type, following this structure:

- `components/`
  - `icon-buttons/`
  - `blog-post/`
  - `post-likes/`
  - `post-comments/`
- `use-cases/`

This example can be executed by running: `VITE_NAME=BlogPostApp npm run dev`.

TIP

In interviews, time constraints often require taking shortcuts. However, it is important to communicate best practices—even when they cannot be fully implemented.

Follow-up question (fundamental skill): "Why is React’s component-based
