	DOM updates.	

With the basics of the Virtual DOM in mind, let’s explore follow-up and probing questions.

Follow-up question (advanced): "Can you walk me through the step-by-step process of how React updates the Virtual DOM and subsequently the real DOM?"

Analysis: After the candidate provides a general overview, the interviewer may ask for a more detailed explanation of React’s rendering process. A strong response would describe the three phases of React’s update cycle—render, pre-commit, and commit—which together form the reconciliation process.

Answer: React’s rendering process involves three main phases—Render, Pre-commit, and Commit—collectively known as the reconciliation process. These phases allow React to perform non-blocking, predictable, and batched updates to the UI. These phases, illustrated in figure 4.4, enable React to perform efficient, non-blocking, and predictable updates to the user interface.

Figure 4.4 React's rendering process: render, pre-commit, and commit phases.
