

- Re-render components
- Calculate the new Virtual DOM
- Create work-in-progress tree
- Diff old vs. new VDOM

```
const oldVDOM = <div>Old Content</div>;
const newVDOM = <div>New Content</div>;
```

- Prepare DOM for updates
- For class components, call getSnapshotBeforeUpdate()

```
class Component extends React.Component {
  getSnapshotBeforeUpdate() {
    return this.listRef.current.scrollTop;
  }
}
```

- Apply changes to the actual DOM
- Set up DOM refs and layout effects
- Trigger browser paint and effect hooks
- For class components, call componentDidMount() or componentDidUpdate()

```
DOM.updateTextContent(divNode, "New Content");
componentDidUpdate(prevProps, prevState,
snapshot) {
  this.listRef.current.scrollTop = snapshot;
}
```
