component state and lifecycle, `useFormStatus` integrates with React Server Components and progressive enhancement features in the browser, specifically handling form submission states and server actions.

Its primary use case is to track the status of form actions—such as whether a form submission is pending, succeeded, or failed—allowing developers to provide better user feedback during progressive form submissions. This capability is essential for Server Components and React's new server-driven UI patterns, where form state management needs to coordinate between client and server rendering phases, making `useFormStatus` part of the `react-dom` package rather than the core React library.

Initial question (applied skill): "What is React's `startTransition` API, and how does it improve performance in input-heavy components? Can you give an example of using `useTransition` to avoid UI blocking?"

Analysis: This question assesses a candidate's ability to understand React's concurrency features and apply them to solve problems. It evaluates whether the candidate can differentiate between urgent updates—like capturing user input—and non-urgent updates—such as filtering large datasets or rendering heavy UI elements.

Answer: The `startTransition` API (https://react.dev/reference/react/useTransition#starttransition) provides a way to separate urgent state updates from non-urgent ones. Urgent updates, such as typing in an input field or clicking a button, should respond immediately to maintain a smooth and responsive UI. Non-urgent updates, like filtering large lists or executing heavy computations, can be deprioritized and run as transitions.

The `useTransition` hook (https://react.dev/reference/react/useTransition#usetransition) offers a declarative approach to managing such transitions. It returns two key values:

- `isPending`: a boolean flag indicating if a transition is in progress.
- `startTransition`: a function that wraps non-urgent updates.

Together, these enable developers to prioritize user interactions while
