Learning Curve	React basics are relatively easy to learn.	Angular has a steeper learning curve.	Vue is the most beginner-friendly framework.
Performance	React uses a Virtual DOM for efficient updates.	Angular employs its own change detection mechanism.	Vue offers lightweight and fast rendering.
State Management	React offers various approaches to handle state management, including using a third-party library to manage global state.	Angular utilizes built-in services and RxJS for state management.	Vue employs Vuex for centralized state management.
Data Binding	React uses one-way data binding, where data flows from parent components to child components through props, but not vice versa.	Angular supports two-way data binding, allowing data to flow bidirectionally between parent and child components.	Vue supports two-way data binding, allowing data to flow bidirectionally between parent and child components.
Routing System	React uses React Router, an external library, for routing. It requires manual installation and setup, but offers flexible routing configuration.	Angular features a built-in routing system with more streamlined, integrated routing solutions.	Vue features a built-in routing system with more streamlined, integrated routing solutions.
