It is important to note that Create React App (CRA, https://github.com/facebook/create-react-app), while still common in interview projects and coding exercises, has been officially deprecated. CRA development stopped at version 5.0.1, and the React team no longer maintains or supports it. Vite (https://github.com/vitejs/vite) has emerged as a popular alternative to CRA, offering improved speed and efficiency in JavaScript development, with support for various frameworks including React.

During interviews, these four environments function similarly, so it is beneficial to be familiar with all of them beforehand. Importantly, writing in JavaScript is typically sufficient, even if the project is set up for TypeScript. This flexibility allows candidates to focus on demonstrating their React knowledge and problem-solving skills rather than getting caught up in the specifics of the development environment or TypeScript syntax. However, be aware that TypeScript linting may raise a warning about an untyped parameter implicitly having an 'any' type, as shown in figure 1.4. This warning can either be explained to the interviewer or resolved by providing a proper type.

Figure 1.4 Create React App with TypeScript, displaying a warning for undefined type.
