A demonstration of semantic HTML elements

Introduction

What is React?

React is a JavaScript library for building user interfaces. React apps are made out of components. A component is a piece of the UI (user interface) that has its own logic and appearance. A component can be as small as a button, or as large as an entire page.

Why use React?

React makes it painless to create interactive UIs. Design simple views for each state in your application, and React will efficiently update and render just the right components when your data changes. Declarative views make your code more predictable and easier to debug.

Jane clarified with the interviewer that she should use semantic HTML elements via JSX to structure the content. She explained to the interviewer that semantic HTML elements are a fundamental concept in HTML. They provide clear, meaningful descriptions of a web page’s structure and content. Rather than using elements solely for their default visual presentation, semantic HTML encourages choosing elements based on their meaning or purpose. Examples include:

- `<title>` defines the title of the page, which is displayed in the browser's
