welcome

Thank you for purchasing the MEAP for *Acing the Frontend Interview*. To get the most out of this book, you should have prior programming experience. It assumes familiarity with core web technologies—HTML, CSS, JavaScript, and TypeScript—as well as a solid understanding of React fundamentals, including declarative UI principles and state management. Equivalent experience with frameworks like Angular or Vue is also applicable. Additionally, hands-on experience with modern web development workflows and a basic understanding of backend technologies will help you fully engage with the material.

This book spans the full frontend stack—from foundational web technologies to advanced React concepts and ecosystem tools—while also introducing essential full-stack knowledge increasingly expected of frontend engineers. It covers the latest advancements, including React 19 and the Vite development environment.

I am a software engineer specializing in frontend development. With over 20 years of experience in enterprise software, I have built and led UI teams at successful startups and Fortune 500 companies, both conducting and participating in technical interviews. I also share knowledge through my web development blog and podcasts (https://jenniferfubook.medium.com/jennifer-fus-web-development-publications-1a887e4454af).

What truly sets this book apart is that its content is grounded in real-world AI and high-tech interview experiences. In the chapters ahead, I introduce practical frameworks—like RADIO for frontend project interviews and STAR for behavioral rounds—to help you communicate your skills with clarity and confidence.

This book is accompanied by practical coding exercises and examples, available at: https://github.com/JenniferFuBook/react-interview.
