To further impress the interviewer, Jane referenced the HTML Living Standard (https://html.spec.whatwg.org), maintained by the Web Hypertext Application Technology Working Group (WHATWG). She pointed out that semantic elements—such as the `<article>` element—are thoroughly defined in this specification (https://html.spec.whatwg.org/#the-article-element). Jane explained that staying up-to-date with the HTML Living Standard is one of the ways she ensures her knowledge remains current with evolving web standards and best practices.

Jane excelled in this interview, and her solution reflects her strong understanding of best practices. Her code can be found at `components/blog-post/BlogPost.tsx` and can be executed with the command: `VITE_NAME=BlogPostExample npm run dev`.

After reviewing Jane's interview process, are you able to answer the questions about semantic HTML at the beginning of section 2.1?

2.2 Separating content from presentation

CSS is a stylesheet language that controls the visual presentation and layout of HTML documents. By separating content (HTML) from presentation (CSS), it enables consistent, maintainable styling across web pages. CSS offers powerful tools like media queries, flexbox, and grid to create responsive, accessible designs that adapt to any device or screen size.

A strong understanding of CSS is essential for frontend development and is frequently assessed in interviews. Interviewers want to see that a candidate can create visually appealing, accessible, and responsive interfaces—skills that go far beyond simply making things look nice.

CSS is developed and maintained by the CSS Working Group (CSSWG), a part of the World Wide Web Consortium (W3C). The CSS living standard is continuously updated and can be accessed at https://www.w3.org/Style/CSS/current-work. CSS has evolved through different levels, each introducing significant new features. As CSS continues to advance, it is essential to understand how these features work and how
