Inline styles	Apply styles directly to elements using JavaScript objects, often for dynamic or unique styles.	`<h1 style={{color: "red"}}>Hello Style`

CSS Modules	Use `.module.css` files to scope styles locally to components, preventing conflicts and improving maintainability.	`import styles from './Button.module.cs`
		`<button className={styles.button}>Clic`
		`Me</button>`

Styled Components	Write CSS in JavaScript using template literals, enabling dynamic and component-scoped styling.	`import styled from 'styled-components'`
		`const StyledButton = styled.button`
		`  background-color: blue;`
		`  color: white;`
		`` `; ``

For most projects, CSS Modules or styled-components are recommended to avoid naming conflicts and improve maintainability, while external CSS files are suitable for global or smaller-scale styles. For example, the `BlogPost` component includes a CSS file to define the font size for the title. The `index.css` file, shown in listing 2.3, is located in `components/blog-post/index.css` and is grouped with its corresponding component, `BlogPost.tsx`, in the `blog-post` folder. This organizational approach makes it easier to manage related files and improves overall project structure.
