	delete unused styles.	
Modern layouts (Grid/Flexbox)	Use CSS Grid and Flexbox instead of float-based or legacy layouts; structure layouts declaratively for better browser optimization.	Cleaner code, better performance
Critical CSS splitting	Identify critical CSS for above-the-fold content and inline it or load it first; defer non-critical CSS.	Reducing render-blocking
CSS effects over images	Use CSS for visual effects (gradients, shadows, etc.) instead of image files wherever possible.	Saving bandwidth, easier maintenance
Mobile optimization	Implement responsive design with targeted media queries to load only the styles needed for each device.	Loads only needed styles
Limit `!important`	Avoid overusing `!important` unless absolutely necessary; refactor CSS to reduce specificity conflicts.	Easier maintenance, fewer conflicts

For this topic, are you able to answer these follow-up/probing questions?

- "What specific techniques do you use to reduce the size and improve the delivery speed of CSS files?"
- "Can you provide examples to simplify CSS selectors?"
- "Can you describe a real-world scenario where you identified a CSS performance bottleneck and how you resolved it?"
- "How do you identify and remove unused CSS for your project?"
- "How do you leverage modern layout techniques like Grid and Flexbox
