4. *Form data encoding*—The collected data is encoded based on the specified HTTP method (GET or POST) and content type (e.g., `application/x-www-form-urlencoded`).
5. *Request sending*—An HTTP request containing the encoded data is sent to the server.
6. *Server-side validation*—The server validates the received data to ensure its integrity and authenticity.
7. *Server processing*—The server processes the form data using appropriate scripts or logic (e.g., storing it in a database).
8. *Response generation*—Based on processing outcomes, the server generates a response (e.g., success message or error feedback).
9. *Response sending*—The server sends the generated response back to the client's browser.
10. *Browser Rendering (for success or failure)*—The browser renders the response, showing a confirmation or redirect on success, or displaying errors and feedback for corrections on failure.

Figure 2.10 Step-by-step illustration of the form submission process.
