

Most of the tech debt stemmed from decisions that we made in earlier sprints to hit an important release date. To combat the issue we decided to have a cleanup sprint where we would refactor the problem code and clean up the backlog of bugs. Once we did that, the number of bugs in sprint was drastically reduced and the number of bug tasks that moved backward also went way down. After using this data to point to a problem, come up with a solution, try it, and watch the data change, we started watching these charts sprint over sprint. Eventually tech debt started to build again, which was clearly visible in our metrics collection system and shown in figure 3.21, starting in sprint 62.

Figure 3.21. The complete data over time
