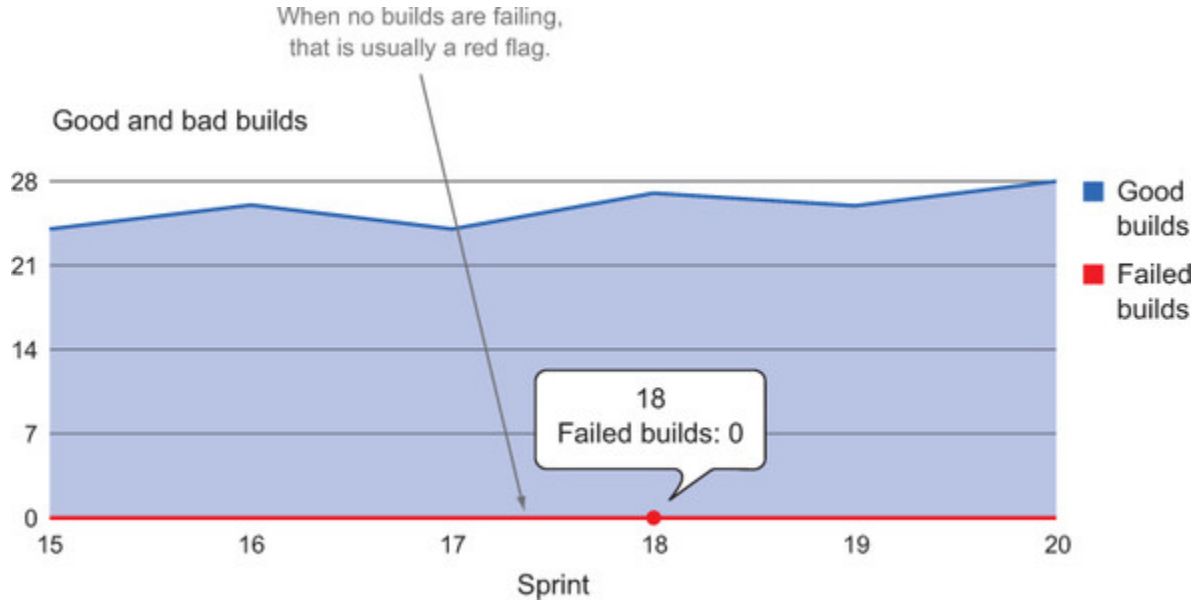

Figure 5.10. It appears that everything is great: no builds are failing.

But as we mentioned earlier in the chapter, that may not always be the case. If you pull more data into the picture like test coverage or test runs, as shown in figure 5.11, you can get a sanity check on whether your builds are worthwhile and doing something of value, or if they're just adding one code delta to the next without checking anything.

Figure 5.11. This is really bad. Builds always pass but there are no tests running and barely any coverage.
