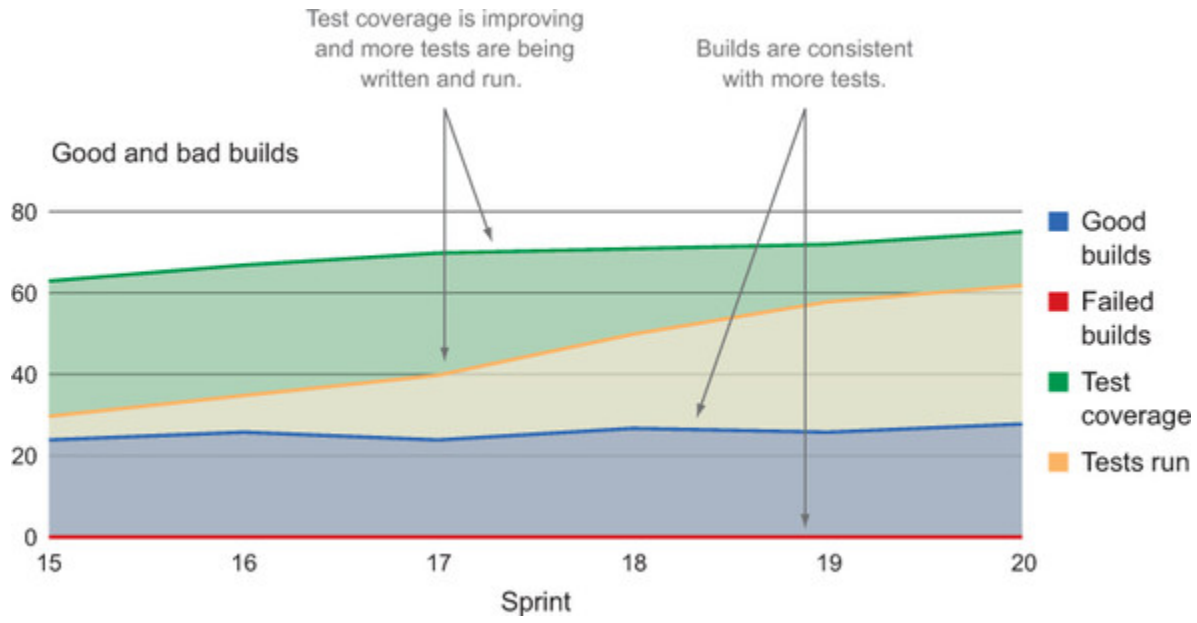

Figure 5.11 shows a team that's generating good builds but not testing anything. In this case what appeared to be a good trend is actually meaningless. If you're not testing anything, then your builds need only compile to pass. You want to see something more like figure 5.12.

Figure 5.12. There are no failing builds, code coverage is going up, and more tests are running every time. It looks like this team has it together.

Another way to visualize your build data is to look at releases over time. If you're releasing at the end of every sprint or every few sprints, it might be more useful to show release numbers as points on your other graphs, like in figure 5.13.

Figure 5.13. Releases charted with other data
