They decided to implement the pull request (PR) workflow to add peer code reviews into their development cycle to help improve the quality of their code. When a developer was ready to commit code, instead of checking it directly into the master branch, they would open a pull request and ask their peers for feedback, as shown in figure 9.6.

Figure 9.6. The proposed updated workflow: moving to pull requests to reduce the number of build failures

In their next retrospective they noticed that their build ratio had improved significantly, as shown in figure 9.7.

Figure 9.7. Good/bad build ratio had improved significantly, but total number of builds had gone down significantly.
