through your workflow are all indicators of how well your team is working together.

The first principle in this list ties team autonomy, or self-organization, directly back to the quality of the software.

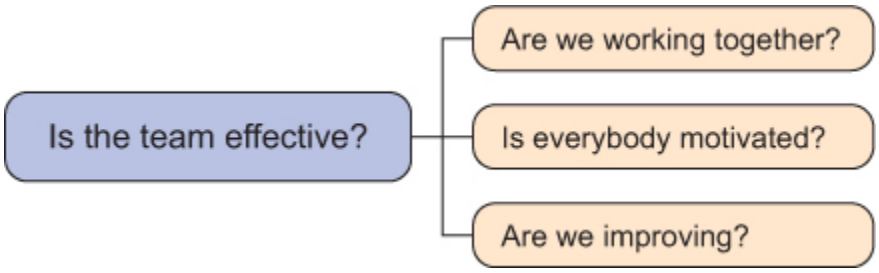

You could argue that the fourth item in this list, reflecting at regular intervals, is a process question because checking and adjusting are part of the agile development process. But I've seen dysfunctional teams take the time to reflect, only to chase the wrong goals because they can't be honest with each other or they don't engage in the improvement process. It's better to measure the ability to check and adjust as part of measuring the effectiveness of your team because it shows your team's ability to face up to their weaknesses and take action to improve them.

The key indicators of good teamwork will be how well things move through your workflow and how your team feels about their work.

10.4.1. Measuring an effective development team

We'll start off again by creating a mind map for these questions, as shown in figure 10.8.

Figure 10.8. Mind mapping "Is the team effective?"

Transposing this over the delivery lifecycle, you'll see that these questions end up spanning the entire lifecycle, as shown in figure 10.9.

Figure 10.9. Transposing the principles regarding the development team over the development lifecycle
