I've identified only a single agile principle that directly addresses requirements, but you can also argue that some of the principles I've categorized under an effective team also apply here because requirements are often a contract between the business, developer, and quality roles on the team. You can look at requirements from a few angles. First, does your development team understand them and can they work with them? Second, do your customers actually get what they want? You can measure those with the following metrics:

- ***Recidivism*** —When recidivism is high, that means someone in the workflow didn't have the same standard as someone downstream. This
