Another lesson learned from doing large-scale data collection is to be wary of the log level of your source systems. I've seen some systems run out of disk space and crash because no one was paying attention to how the system was logging.

A.2. Creating the dashboard

The front end is the open source graphing system Kibana. Once you have data in EC, Kibana is already wired up for you to start creating nice charts and graphs. Figure A.4 shows a few ways to create graphs with Kibana.

Figure A.4. A few simple ways to create new graphs in Kibana

At the time this book was published Kibana 4 had just been released. Thus, many of the figures have charts from Kibana 3, though the system has been upgraded to use Kibana 4. For the latest information on how to set up a Kibana dashboard check out my blog at www.cwhd.org/, or read through the Kibana documentation on the EC website.
