Figure 4.20. The same data with variance decreases between bugs and other data

Figure 4.21. Adding comments to the graph and finding an ugly trend

Figure 4.22. Everything is trending in the right direction!

Chapter 5. Trends and data from CI and deployment servers

Figure 5.1. You are here: continuous integration in the application lifecycle.

Figure 5.2. The hows from CI: the basic questions you can answer

Figure 5.3. The simplest possible CI pipeline. When developers check in changes, the CI system builds an artifact.

Figure 5.4. A build script running on a CI server controlling a multistep build process

Figure 5.5. An example of a complex build chain

Figure 5.6. Continuous testing in the scope of CI/CD

Figure 5.7. The weather report from Jenkins

Figure 5.8. A healthy-looking project based on good and bad builds

Figure 5.9. A worrisome trend: lots of bad builds

Figure 5.10. It appears that everything is great: no builds are failing.

Figure 5.11. This is really bad. Builds always pass but there are no tests running and barely any coverage.

Figure 5.12. There are no failing builds, code coverage is going up, and more tests are running every time. It looks like this team has it together.

Figure 5.13. Releases charted with other data

Figure 5.14. Showing all build pass/fail percentages for a team deploying code multiple times a day and the percentage filtered by builds that trigger a release. By hovering over the charts in Kibana, you can see the percentage associated with the pie slices.

Figure 5.15. The graph the team ended with in the last chapter. Everything is looking good.
