Chapter 7. Working with the data you're collecting: the sum of the parts

Figure 7.1. Building metrics in the context of collecting, analyzing, and applying metrics

Figure 7.2. Labels, code comment counts, recidivism, and development time for tasks labeled "sharing" over the course of a single sprint

Figure 7.3. Labels for tasks not marked with "sharing" over the course of a sprint

Figure 7.4. The relationship among recidivism, development time, code comments, and estimates

Figure 7.5. Stats around a painful release. Even though development time looked great, there were nagging bugs that caused hot fixes over a long period.

Figure 7.6. A very different release with a better support tail, lower recidivism, and longer development time

Figure 7.7. The historical estimate distribution and average estimate dashboards for a team

Figure 7.8. Adding average time a task takes to get to done. This doesn't look right; an average estimate of 3 should be 2–3 days.

Figure 7.9. Labels show what has been tagged in the cards where estimations are off, and recidivism shows that tasks tend to move backward in the workflow more frequently when estimates are 3 or 5.

Figure 7.10. Breaking down how to measure teamwork with a mind map

Figure 7.11. Breaking down a problem with a mind map; starting with your question and then breaking it down one level

Figure 7.12. Using the mind map to break it down another level and then figuring out where to get data from

Figure 7.13. A visual representation of a series of estimates next to time using the Fibonacci series of estimates over a two-week period

Figure 7.14. A visual representation of the algorithm to determine estimate health
