

You should look for the following pieces of data in your tasks so you can index them, search them, and aggregate them for better analysis:

- User data.
- Who worked on the task?
- Who assigned the task?
- Who defined the task?
- Time data.
- When was the task created?
- When was it complete?
- What was the original estimate of the task?

Who, what, and when are the building blocks that we're going to focus on in this chapter. Some raw response data is demonstrated in the following listing.

Listing 3.1. Excerpts from the raw data in a typical API response
