Listing 4.13 `crewai_introduction.py` (crew section)

```
crew = Crew(
    agents=[joke_researcher, joke_writer],    #1
    tasks=[research_task, write_task],     #2
    process=Process.sequential,      #3
    memory=True,      #4
    cache=True,     #5
    max_rpm=100,     #6
    share_crew=True,     #7
)

result = crew.kickoff(inputs={"topic": "AI engineer jokes"})
print(result)
```

#1 The agents assembled into the crew
#2 The tasks the agents can work on
#3 Defining how the agents will interact
#4 Whether the system should use memory; needs to be set if agents/tasks have it on
#5 Whether the system should use a cache, similar to AutoGen
#6 Maximum requests per minute the system should limit itself to
#7 Whether the crew should share information, similar to group chat

When you're done reviewing, run the file in VS Code (F5), and watch the terminal for conversations and messages from the crew. As you can probably tell by now, the goal of this agent system is to craft jokes related to AI engineering. Here are some of the funnier jokes generated over a few runs of the agent system:

- Why was the computer cold? It left Windows open.
- Why don't AI engineers play hide and seek with their algorithms? Because no matter where they hide, the algorithms always find them in the "overfitting" room!
- What is an AI engineer's favorite song? "I just called to say I love yo… . and to collect more data for my voice recognition software."
- Why was the AI engineer broke? Because he spent all his money on cookies, but his browser kept eating them.

Before you run more iterations of the joke crew, you should read the next section. This section shows how to add observability to the multi-agent system.
