Listing 5.14 `SK_native_functions.py` (`MySeenMovieDatabase`)

```
class MySeenMoviesDatabase:
    """
    Description: Manages the list of users seen movies.     #1
    """
    @kernel_function(     #2
        description="Loads a list of movies … user has already seen",
        name="LoadSeenMovies",
    )
    def load_seen_movies(self) -> str:     #3
        try:
            with open("seen_movies.txt", 'r') as file:     #4
                lines = [line.strip() for line in file.readlines()]
                comma_separated_string = ', '.join(lines)
            return comma_separated_string
        except Exception as e:
            print(f"Error reading file: {e}")
            return None
```

#1 Provides a description for the container class
#2 Uses a decorator to provide function description and name
#3 The actual function returns a list of movies in a comma-separated string.
#4 Loads seen movies from the text file

With the native function defined, we can see how it’s used by scrolling down in the file, as shown in the following listing.
