

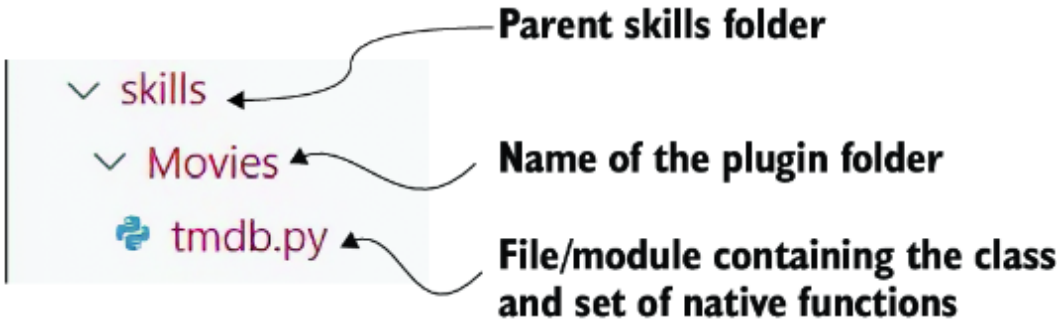

**Figure 5.9 The folder and file structure of the TMDB plugin**

Open the `tmdb.py` file in VS Code, and look at the top of the file, as shown in listing 5.18. This file contains a class called `TMDbService`, which exposes several functions that map to API endpoint calls. The idea is to map the various relevant API function calls in this semantic service layer. This will expose the functions as plugins for a chat or agent interface.
