Listing 7.5 `.vscode/launch.json`

```
{
  "version": "0.2.0",
  "configurations": [
    {
      "name": "Python Debugger: Module",     #1
      "type": "debugpy",
      "request": "launch",
      "module": "streamlit",     #2
      "args": ["run", "${file}"]    #3
    }
  ]
}
```

#1 Make sure that the debugger is set to Module.
#2 Be sure the module is streamlit.
#3 The ${file} is the current file, or you can hardcode this to a file path.

After you have the `launch.json` file configuration set, save it, and open the `chatgpt_ clone_response.py` file in VS Code. You can now run the application in debug mode by pressing F5. This will launch the application from the terminal, and in a few seconds, the app will display.

Figure 7.5 shows the app running and waiting to return a response. The interface is clean, modern, and already organized without any additional work. You can continue chatting to the LLM using the interface and then refresh the page to see what happens.
