Memory Type
SEMANTIC
Select SEMANTIC as the type of memory.
Memory Function:
Memory function for adding new memories
Summarize the facts and preferences in the conversation. Return a JSON object with the following keys: 'questions', 'facts', 'preferences'. Each key should have a list of statements that are relevant to that category. Return only the JSON object and nothing else.
Augmentation Prompt:
Augmentation function is called to extract relevance before querying a memory store.
Generate a set of questions that can be asked based on the conversation. Return a JSON object with the following keys: 'questions'. Each key should have a list of questions that can be asked based on the conversation. Return only the JSON object and nothing else.
Summarization Prompt:
Summarization function is used in memory compression.
Given a list of personal memories described below, synthesize these into a concise narrative that captures their essence, emotional significance, and any common themes. Focus on the underlying feelings, lessons learned, or how these memories collectively shape my understanding of a particular aspect of my life. Please merge similar memories and emphasize unique insights or moments of growth. The aim is to create a compact, meaningful representation of these
