
Prompt Engineering Strategies
Evaluation and Feedback
Think of these as axes: the y-axis represents thought, and the x-axis represents planning.
Split Complex Tasks into Simpler Subtasks
Reduces error rates.
Tactics include intent classification, summarizing dialogues, and piecewise summarization of documents.
Planning
Question-and-answer prompting
One-shot prompting
Zero-shot prompting
Solutions—prompts in this group are direct and may include examples of completed tasks.
Chain of thought prompting
Prompt chaining
Reasoning—prompts demonstrate reasoning by encouraging a thought process and solving a sequence of thoughts.
Self-consistency prompting
Tree of thought prompting
Evaluation—multiple prompts are generated and evaluated based on the goal.
Automatic reasoning with tools (ART)
Planners
Tooling—the ability to use tools, actions, planners, and specialized prompts to solve tasks and high-level goals.
Adaptive constructive feedback
Multi-agent systems
Feedbacek—xtends planning but also engages with perceived or genuine feedback to continually adapt and improve plans.
Thought
Give Models Time to "Think"
Allows more reliable reasoning.
Tactics involve working out solutions before conclusions, using inner monologue, and reviewing previous answers.
Planning
All of these concepts will be covered in this chapter.
