execute loops. However, because prompt flow provides a batch processing mechanism, we can use that to simulate loops or repetition in a flow.

Referring to figure 10.6, we can see that self-consistency processes the input three times before collecting the results and determining the best plan/reply. We can apply this same pattern but use batch processing to generate the outputs. Then, the evaluation flow will aggregate the results and determine the best answer.

Open the `self-consistency-prompting/cot.jinja2` prompt template in VS Code (see listing 10.16). The listing was shortened, as we've seen parts before. This prompt uses two (few-shot prompt) examples of a CoT to demonstrate the thought reasoning to the LLM.

Listing 10.16 `self-consistency-prompting/cot.jinja2`

```
system:

"In a time travel movie, Sarah travels back… "     #1

Chain of Thought:

    Initial Assumption: …     #2
    Conclusion: Sarah spends 729 days in the past before the day of the event.

"In a complex time travel movie plot, Max, a 25 year old…"     #3

Chain of Thought:
    Starting Point: Max starts …     #4
    Conclusion: After the final jump,
Max finds himself in the year 1980 and he is 75 years old.
Think step by step,
 but only show the final answer to the statement.     #5

user:
{{statement}}
```

#1 The Sarah time travel problem
#2 Sample CoT, cut for brevity
#3 The Max time travel problem
#4 Sample CoT, cut for brevity
#5 Final guide and statement to constrain output

Open the `self-consistency-prompting/flow.dag.yaml` file in VS Code. Run the example in batch mode by clicking Batch Run (the beaker icon) from the visual editor. Figure 10.8 shows the process step by step:

1. Click Batch Run.
