the model will execute them and return the results. In the next section, we'll explore sequential planning and then demonstrate it in action.

11.2 Understanding the sequential planning process

In the next exercise, we'll ask an OpenAI assistant to solve the same goal. If you have Anthropic/Claude credentials and have the engine configured, you can also try this exercise with that model.

Figure 11.5 shows the difference between executing tasks sequentially (planning) and using iteration. If you've used GPTs, assistants, or Claude Sonnet 3.5, you've likely already experienced this difference. These advanced tools already incorporate planning by prompt annotations, advanced training, or combining both.
