We’ll use the same goal but, this time, run it against an assistant (which has built-in planning).

After you launch the Playground, create a new assistant, and assign it the `search_ wikipedia, get_wikipedia_page`, and `save_file` actions. Figure 11.6 shows the results of entering the goal to the assistant. As you can see, the assistant completed all the tasks behind the scenes and responded with the user’s final requested output, achieving the goal.
